INCUBATION CENTER

INNVOTECH ALLEY - NAVAMARGH

Sri Venkateshwaraa Dental College strives to broaden its horizon in dental education and research, in the name of “**INNVOTECH ALLEY-NAVAMARGH**”. To attain this, the institute has registered in IICportal (an initiative of MHRD) -registration number **IIC –IC202115837**.

Innvotech alley- Navamargh encourages, motivates faculties and students to venture into new research innovations, projects, copyrights and patents focusing on societal benefits. This platform also takes steps to instill and promote technology based entrepreneurship spirit among students and faculties.

VISION & MISSION:

1. Create opportunity to prospective students to showcase their innovative ideas through competitions and brainstorming.
2. Explore innovative ideas or concepts from students, research scholars, and faculty from various specialties.
3. Provide a technically sound environment with guidance from the experts, legal advice, market linkage and networking and thereby build a platform for the aspirants where their innovative ideas can be incubated and realized or made into a sustainable reality.
4. Educate students and faculty members regarding various aspects of entrepreneurship like new business prospects or government schemes.
5. Facilitate national and international collaborations for the innovative ideas.

Sri Venkateshwaraa Medical College Hospital & Research Center has established a Central Research Laboratory to strengthen research and transfer of knowledge. A Memorandum of Understanding was signed between Sri Venkateshwaraa Medical College Hospital & Research Center and Sri Venkateshwaraa Dental College for the utilization of Central Research Laboratory (CRL). Certain facilities of the CRL and its roles and functions are described during the Lecture class to the third years, final year, interns and post graduate students to motivate them towards research activities.

PRINCIPAL
SRI VENKATESHWARAA DENTAL COLLEGE
ARIYUR, PUDUCHERRY - 605 102.

Central Research Laboratory houses a state of art infrastructure facility for research with modern instruments like Thermal Cycler, Gel Documentation System (transilluminator) , High Performance Liquid Chromatography (Isocratic Model), Upright Freezer (-20° C,-80□), Digital PH Meter (bench Top),Mini Centrifuge, Ultra Sonic washer , UV/Visible Spectrophotometer,Submarine Gel Electrophoresis Horizontal, Biosafety Cabinet With Virus Burnout, Autoclave,Incubator, Hot Air Oven, Refrigerated Centrifuge, BiologicalMicroscope and Cytogenetics lab.

Innovation,Patent and copyrights

The Institute encourages the students and faculty to approach the research committee and the IIC convener to register their idea, in an online repository link of the college, called as “GEAR BOX”. The importance of entrepreneurship, startups and Intellectual property rights are imparted throughvarious programs conducted at the college. The institute supports their ideas throughfunding and guidesthem to reach the goal and successfully enroll for patentingand ultimately aim for commercialization through effective development and launch of new products. Thisenables the individual to achieve greater heights in their profession.

The process is explained in the following steps:

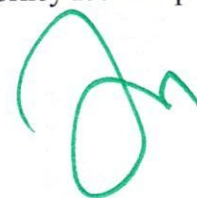

Step 1 – Register with the Incubation centre

Step 2 – Abstract writing and designing

Step 3 – Scrutiny of the proposal by the Research committee reviews the projects and preparation of proposals for patent filling through thePatent attorney designated by the institution.

Step 4 – Patent filling

Step 5 – Funding by the institution for patent filing (inclusive of attorney fee and patent fillingprocedures)

RVG VIDEO- A NEW ASSISTANT TO DENTIST

NAME OF THE STUDENT- Dr.Jaysuriya

YEAR OF THE STUDY – CRR1

INTRODUCTION ABOUT XRAY,

X-ray, is a penetrating form of high-energy electromagnetic radiation. Most X-rays have a wavelength ranging from 10 picometers to 10 nanometers. X-ray imaging creates pictures of the inside of your body. The images show the parts of your body in different shades of black and white. This is because different tissues absorb different amounts of radiation.

Dental X-rays (radiographs) are **images of your teeth that your dentist uses to evaluate your oral health**. These X-rays are used with low levels of radiation to capture images of the interior of your teeth and gums.

RadioVisioGraphy(RVG)

The **RVG imaging system** commonly used in dentistry to take intraoral periapical radiographs features the latest innovations in digital radiography, delivering the highest image resolution (> 20 LP/mm). RVG consists of a sensor, monitor, and microcomputer components.

ADVANTAGE OF RVG.

- Substantial radiation dose reduction.
- Production of instantaneous image.
- Control of contrast.
- Ability to enlarge specific areas that may be of use in visualizing instrument location during endodontic treatment.
- Potential for storage in a computer and subsequent transmission of the image.

PRODUCT OUTLINE

As low as diagnostically achievable has become an important criteria while subjecting any patient to radiation exposure for diagnostic purpose.

In recent times RVG has become fast emerging and have been used widely in day to day clinical practice. With the help of RVG image captured can be stored for a long period of time and can be used for future reference. By incorporating video format in RVG it serves a numerous purpose like endo procedure can be performed even more accurately through video format RVG .

SENSOR BASED DENTAL TRIMMER.

NAME OF THE STUDENT -DR.AKSHYA PRIYA

YEAR OF THE STUDENT - CRRI

INTRODUCTION ABOUT THE HAND HELD TRIMMER

Dental micromotors are commonly used to treat semi-hard dental tissues in dentistry. A variable connection mechanism connects this instrument to the hoses of other dental equipment. Straight handpiece micromotors: In this case, the shape of the instrument is straight, and its primary use is for surgeries on third molars and retouching of dental prostheses. Pneumatic and electric, of very small and ergonomic sizes, ideally suited for your dental clinic.

ADVANTAGES

- High torque, which means handpieces can also have increased speeds.
- Easily adjustable with interchangeable head.
- Used to treat semi-hard dental tissues

PRODUCT OUTLINE

The aim of the product is to prevent soft tissue trauma from dental trimmers. A sensor dental trimmer that detects the hand of the person who trims by detecting the blood vessels and stops automatically when in contact with the fingers rather than that of the denture or dental material that is to be trimmed.

MINIATURIZED PH MONITORING DEVICE.

NAME OF THE STUDENT-MR. KEERTHAN

YEAR OF STUDY- FINAL YEAR BDS

ABSTRACT

Saliva sampling is a modernized and non-invasive technique. Mild variations in the pH of saliva can be an indication of various dental and general health conditions. Caries is caused when pH drops below 5.5, the teeth begin to demineralize putting them at risk for cavities/carious formation. Remineralization occurs at a pH of 7.5 and above. Mineralization is a dynamic process by which inorganic nanocrystals precipitate onto organic matrix. [to form hybrid biological tissues like enamel, dentin] . Demineralization is highly exacerbated during an acid attack when salivary pH falls to the critical level of pH 5.5 and below.

SIGNIFICANCE OF pH

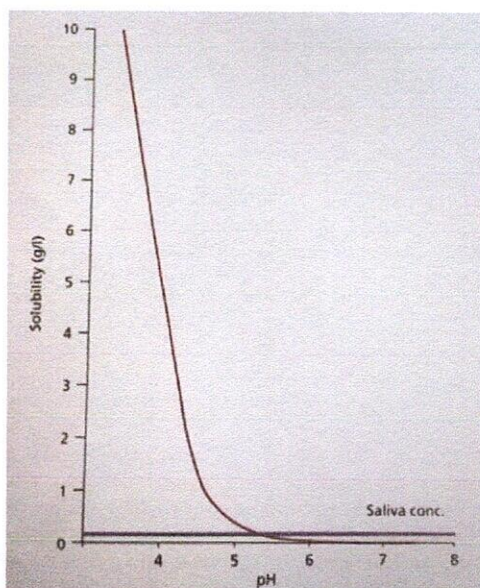

As the ecological plaque hypothesis states, in neutral pH, the host and resident bacteria live in a symbiotic state. Slight changes in pH causes a shift and this shift from alkaline to acidic allows for an oversaturation of pathogens that metabolic acids. Even though the tooth is surrounded by a protective acquired pellicle, a prolonged acidic environment will allow acids to diffuse and initiate demineralization process. Calcium, fluoride, and phosphates ions present in saliva promote remineralization. When pH in the surrounding medium {saliva} decreases, the solubility of the tooth mineral apatite increases dramatically.

Solubility of hydroxyapatite as a function of pH. Salivary concentrations of calcium and phosphate are indicated by the horizontal line. The solubility of apatite increases considerably as pH decreases.

It should be noted that caries develop in the pH range around 4.0 -5.5, while the teeth are eroded in the pH range 2.5-4.0. {courtesy;DC by fejerskov,nyvad}

THE CONNECTION BETWEEN pH AND DIMINERALIZATION

As pH is lowered in the oral fluids i.e., saliva and plaque fluid, the supersaturation with respect to hydroxyapatite is reduced at "critical pH" the fluids become just saturated with respect to hydroxyapatite. Because fluorapatite is less soluble than hydroxyapatite is, plaque fluid remains supersaturated with respect to fluorapatite. When it is undersaturated with respect to hydroxyapatite - these conditions favour carious formation.

Lower the pH, greater the tendency for dissolution of enamel apatite.

WHY IS APATITE SOLUBILITY INCREASED BY ACID / ACIDIC pH?

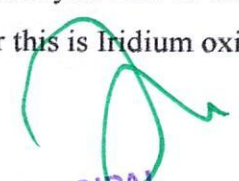

The solubility of hydroxyapatite and other calcium phosphates is greatly affected by the pH.

This acts on the basis where there is alkaline medium phosphates and bicarbonates accumulate along with calcium, hence the dissolution of hydroxyapatite slows down and stops as the solution becomes saturated. In acidic medium / when acid interferes the phosphate ions and bicarbonate combine with the hydrogen ions to form hydrogen phosphate ions and the solution is undersaturated and hence as a result of this hydroxyapatite dissolves until saturation is re-established. This results in dissolution of tooth mineral/ demineralization.

MODEL:

A Miniaturized Ph monitoring device.

The objective is to construct a working model – A Biomonitoring device with wireless nanotechnology. The miniature can be placed mechanically or can be adhesively bonded to the tooth which can monitor and signal the fluctuations in Ph. This device is a biosensor and a non-invasive technique. Power supply of this system will be nanofabricated biocatalytic fuel cell (Enzymatic micro-battery) using organic compounds (E.g.: Formate or glucose) as a fuel to generate electricity. This provides long term Ph monitoring and provides real time data. It calculates the variations and fluctuations in the Ph and via the Near Field Communication (NFC) or Bluetooth it is transmitted to a hand free device. This uses a microprocessor-based design and can detect near accuracy of the Ph changes. An auto buffer mechanism can also be added. Bluetooth offers the lowest power consumption among the wireless transmission techniques. Nano Bio Catalysis aids in this mechanism of Ph detectors. The data gathered can be transmitted to PAN as well as LAN (Local Area Network) and can be stored in cloud for a collection assessment or study to evaluate its efficiency. The use of catalytic fuel is done taking biocompatibility in consideration. However, another substitute for this is Iridium oxide Ph sensor.

ARIYUR, PUDUCHERRY - 605 102.

CONCLUSION:

A wireless system for continuous in mouth, non-invasive Ph monitoring with a simple user interface on a hands-free device and a NFC or Bluetooth transmission, variations and fluctuations in Ph can be detected and this aids in the prevention of caries. Early detection and intervention are the key goal of this device. This can be achieved by the unanimous function of the nanofabricated Ph monitor and the data signalling or transmission.

ORAL RECOGNITION

INTRODUCTION

Introducing a new method of identification of a person by using the database of oral cavity

CONTENT

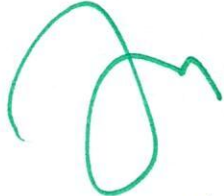

- Identification of a person is done by many methods like fingerprint, retina recognition, face recognition etc;
- But they are mostly used when the person is alive and sometimes in deceased. It is known as biometric.

PRINCIPAL
RI VENKATESHWARAAA DENTAL COLLEGE
ARIYUR, PUDUCHERRY - 605 102.

- In some cases after death, victim can't be identified by these methods. Because the identifying part will be damaged or decomposed.
- For eg, a dead body is taken from a sea or lake in a decomposed state. Which can't be identified by fingerprint, retina scan, face recognition, etc. Even though DNA test also cannot be done while the dead body is decomposed fully.
- In that case, we can do oral recognition. Oral recognition means identifying the victim by his teeth arrangement, measurements of jaws, X-rays of each and every tooth and complete X-ray of oral cavity and unique specifications of each tooth like what type of restoration done in the tooth.
- Complete oral identification process should be done for 6 months or yearly once. For updating the information of the person.
- And the information should be done as record and kept as a database.

USES

- It is useful for identification of threatful peoples like NAVY, AIRFORCE, ARMY, etc ; in a mass disaster and to identify the victims.
- It can also be useful for politicians.

Sri Venkateshwaraa Dental College comes under the umbrella of Sri Venkateshwaraa Group of Institutes. The Central Research Laboratory available in the medical college campus, serve to create a research ecosystem and to stimulate the ingenious minds of the youngsters especially the students. The platform acclaims to be a promethean with extensive support for the faculty to enhance their research and create innovative ideas.

The facilities of Sri Venkateshwaraa Medical College and Research Center, have been made available for the undergraduate training as a part of the curriculum. The Central Research Laboratory provides training for undergraduate students. Few equipment's were demonstrated to the undergraduates as part of the curriculum. Equipment like binocular microscope have been demonstrated and were used by the students for the visualisation of different staining of the microorganisms. Physical balance have been used by the students in Biochemistry for the calculation of the weight of the powder. Centrifuge have been demonstrated to the students to show the processing of biological fluids. Pipettes are used regularly by the students for the regular practical classes in the biochemistry lab. Real time – PCR was demonstrated to the undergraduates and a post graduate dissertation proposal was designed with an objective of performing metagenomic analysis using RT-PCR with the approval of the research and ethics committee. Spectrophotometer has been demonstrated for the undergraduates for the purpose of shade measurement of the dental fillings / restorative materials. The shade measurements have been further taken for aesthetic analysis or analysis for discoloration. In accordance to this lieu, the research pattern for the postgraduate students will be designed accordingly.
